

BACTIVATE GROW (Microbial Fertiliser)

Bactivate helps rebuild soil structure (increasing its soil nutrient and water holding capacity). It contains organic nitrogen and trace elements and, importantly, live beneficial soil bacteria and fungi that assist in activating quality certified organic fertilizers, such as the Searles' range of 'Kickalong' products.

Bactivate is formulated to promote healthy plant growth and is full of living organisms often absent due to the use of products like artificial pesticides, herbicides and fertilizers. These organisms convert nutrients into usable plant food and assist in discouraging diseases including nematodes, in the soil. Create a rich , fertile soil in your garden safe for people and animals alike .

Bactivate containers are made from a biodegradable plastic and corn husks.

All plants (even in pots) can benefit from Bactivate – either in disease control or by creating healthy growth in new or long established plants.

For best results, sprinkle a handful per square metre digging into the top 10cm of soil. Alternatively, make a shallow 10cm groove around each plant's drip-line, sprinkle and water in. If working with poor sand or clay- double the quantity. Remember – the more good bacteria that you put into the soil, the better! Don't forget to add Dawson's soil improver as usual when planting, thoroughly mixing with your soil.

Before laying turf or applying mulch to the surface of garden beds, spread Bactivate and mix in soil improver to assist in moisture retention and to promote healthy microbial activity.

HEALTHY SOIL!

HEALTHY PLANTS!

HEALTHY ENVIRONMENT!

TRY IT!
